this book presents a self contained and unified introduction to the properties of analytic functions based on recent research results it provides many examples of functional equations to show how analytic solutions can be found unlike in other books analytic functions are treated here as those generated by sequences with positive radii of convergence by developing operational means for handling sequences functional equations can then be transformed into recurrence relations or difference equations in a straightforward manner their solutions can also be found either by qualitative means or by computation the subsequent formal power series function can then be asserted as a true solution once convergence is established by various convergence tests and

majorization techniques functional equations in this book may also be functional differential equations or iterative equations which are different from the differential equations studied in standard textbooks since composition of known or unknown functions are involved

this handbook is the fourth volume in a series of volumes devoted to self contained and up to date surveys in the theory of ordinary differential equations with an additional effort to achieve readability for mathematicians and scientists from other related fields so that the chapters have been made accessible to a wider audience covers a variety of problems in ordinary differential equations pure mathematical and real world applications written for mathematicians and scientists of many related fields

common feature is that these evolution problems can be formulated as asymptoti cally small perturbations of certain dynamical systems with better known behaviour now it usually happens that the perturbation is small in a very weak sense hence the difficulty or impossibility of applying more classical techniques though the method originated with the analysis of critical behaviour for evolu tion pdes in its abstract formulation it deals with a nonautonomous abstract differ ential equation nde 1 ut a u c u t t 0 where u has values in a banach space like an lp space a is an autonomous time independent operator and c is an asymptotically small perturbation so that c u t t as t 00 along orbits u t of the evolution in a sense to be made precise which in practice can be quite weak we work in a situation in which the autonomous limit differential equation ade ut a u 2 has a well known asymptotic behaviour and we want to prove that for large times the orbits of the original evolution problem converge to a certain class of limits of the autonomous equation more precisely we want to prove that the orbits of nde are attracted by a certain limit set 2 of ade which may consist of equilibria of the autonomous equation or it can be a more complicated object
